

ANDELL JEAN-JACQUES

Applied AI Engineer | Full-Stack AI Systems

Orlando, FL | (407) 765-5182 | ajeanjacques42@gmail.com | linkedin.com/in/ajejan144 | github.com/AJean144 | andelljean.me

SUMMARY

Full-stack engineer with 12+ years shipping production systems across healthcare, edtech, fintech, civic technology, and retail. Runs a solo consultancy where the work starts with the client's business problem and ends with a deployed system: discovery, scoping, statement of work, milestone delivery, change orders, and handoff. Builds production AI systems including RAG pipelines, custom MCP servers, and agentic development workflows, and contracts through G2i on AI projects for a leading frontier lab. Comfortable as the only engineer in the room with a non-technical owner or executive, and equally comfortable owning what breaks after launch.

CORE COMPETENCIES

Applied AI: RAG pipelines, vector databases (Chroma), OpenAI and Anthropic APIs, Model Context Protocol (custom MCP servers), prompt engineering, LLM-as-judge evaluation, agentic workflows (Claude Code, Cursor), AI code quality gates

Backend & Data: Node.js, Express, Ruby on Rails, Python, C#/.NET Core, PostgreSQL, MySQL, Redis, Sidekiq, REST, GraphQL

Cloud & Infrastructure: AWS (EC2, S3, Lambda), Azure, Vercel, Render, Cloudflare Workers, Docker, CI/CD pipelines

Frontend: React, Next.js (App Router), TypeScript, THREE.js, Tailwind, design systems, Core Web Vitals, accessibility

Client-Facing: Discovery and requirements gathering with owners and executives, statements of work, scope and change management, technical documentation, team enablement and mentoring

EXPERIENCE

Founder & Principal Engineer Jan 2024 – Present

RapidFire Agency — Orlando, FL

- Own client engagements end to end: run discovery with owners and executives to locate the actual operational bottleneck, translate it into a scoped engineering problem, write the statement of work, deliver the build, and hand off documentation and training.
- Scoped and delivered a multi-phase internal data platform for an NDA client, covering phased milestones, a mid-engagement change order, and a production system the client's team now operates on its own.
- Built and shipped a municipal court case management platform on Azure for a court services provider, including a plate lookup API and a branded document generation pipeline producing client-facing PDFs.
- Built RAG applications on vector databases and LLM APIs to make domain-specific document sets queryable for professional services and healthcare clients.
- Designed AI scaffolding review processes and code quality gates for AI-generated code, defining typing patterns, naming conventions, and accessibility requirements applied to both human- and model-authored work.
- Replaced manual data entry workflows for small-business clients with custom automation, cutting recurring task time from roughly four hours to about one.

Software Engineer (Contract) 2025 – Present

G2i — Remote

- Work with G2i on AI projects for a leading frontier AI lab, applying expert software engineering and code quality judgment in the AI space. Engagement details are covered by NDA.

Senior Software Engineer (Contract) Oct 2025 – Apr 2026

Rooms to Go — E-Commerce Retail

- Led a multi-quarter frontend modernization on the ModularOne product line, building an interactive 3D furniture configurator in THREE.js and Next.js so customers could customize layouts, select fabrics, and rotate products before purchase on a line averaging \$2,000+ per order.
- Engineered the rendering pipeline: scene lighting, camera controls, texture mapping for real-time fabric selection, and model loading for new configurations.
- Integrated the configurator with product and pricing services for live price updates as customers changed their layouts, and tuned rendering performance for stable frame rates on desktop and mobile.

Senior Software Engineer May 2024 – Apr 2025

TRAILS — EdTech, Youth Mental Health Platform

- Delivered full-stack features on a Next.js, Strapi, and PostgreSQL platform serving thousands of educational institutions, with substantial API integration and content modeling work.
- Traced sub-second load-time regressions to database query bottlenecks, resolved them, and added code splitting, improving Core Web Vitals platform-wide.
- Cut development cycle time roughly in half by establishing reusable TypeScript component libraries and automated testing workflows.
- Authored the technical documentation and code review process that reduced new developer onboarding from three weeks to two.

Senior Software Engineer & Team Lead Jan 2021 – Feb 2024

Everly Health — Consumer Healthcare

- Led a frontend team on a high-traffic consumer healthcare platform built on React, GraphQL, Contentful, and Ruby on Rails with PostgreSQL on AWS, owning delivery across the product line.
- Shipped 15 consumer-facing payment features including ApplePay and Google Pay with complex validation logic, working directly with product managers on high-value requirements.
- Drove a multi-quarter performance initiative that improved application response times roughly 60% through query optimization, indexing, and eliminating N+1 queries via eager loading.
- Extended a TypeScript UI component library with modern React patterns, reducing duplication and accelerating team velocity.
- Mentored junior developers through structured review and pair programming, halving time to independent feature delivery.

Senior Front-End Engineer Sep 2019 – Jan 2021

Politech — Civic Technology

- Architected a React/Redux campaign management platform for voter outreach, fundraising, and volunteer coordination, including a Stripe integration that processed \$2M+ in contributions.
- Kept the platform up through election-day traffic spikes at roughly 15x normal load using Redis caching and query optimization, with no downtime during the critical window.

Senior Software Engineer Sep 2017 – Sep 2019

Differential Consulting

- Built full-stack 3D visualization applications in React, GraphQL, Ruby on Rails, and THREE.js for client sales teams, including interactive browser-based configuration tools.
- Delivered cross-platform React and React Native applications with external API integrations and Rails background jobs for financial services clients.

LEADERSHIP & COMMUNITY

Founder & Mentor 2019 – Present

"Each One Teach One" Initiative

- Founded and run a mentorship program for underrepresented engineers entering tech, providing structured technical training and career guidance in the Orlando community.

Speaker & Technology Lead Jan 2025 – Present

Technology Focus Group @ The Citrus Club

- Lead recurring sessions on AI-assisted development and modern architecture for a professional audience that is largely non-engineering, translating technical trade-offs into business terms.

EDUCATION

Software Engineering Certificate — The Iron Yard, 2015
